1. AI Maturity Framework

This framework provides a structured, repeatable approach for evaluating an organization's current AI capabilities and charting a clear path toward greater AI adoption. It is designed to be industry-agnostic and accessible to business leaders without deep technical knowledge.

The framework evaluates organizations across seven core dimensions:

- **Business Strategy:** Leadership understanding, executive sponsorship, and alignment of AI with business goals.
- **Data Readiness:** Quality, accessibility, governance, and integration of organizational data.
- **Technology Infrastructure:** Cloud adoption, system integration, APIs, and compute capacity.
- **Talent & Skills:** Internal AI and data expertise as well as data literacy across teams.
- **Use Case Readiness:** Identified AI applications, problem clarity, and expected return on investment.
- **Operational Readiness:** Degree of process digitization, workflow automation, and change management capability.
- **AI Governance:** Ethical AI policies, security and compliance posture, and model monitoring practices.

Each dimension is scored independently, and the scores are combined to determine the organization's overall AI maturity level.

2. AI Maturity Levels

Organizations are classified into one of five maturity levels based on their assessment scores.

Level 1 — AI Unaware

Score Range: 1.0 – 1.5

The organization has little to no awareness of AI or its potential business impact. Data is fragmented, processes are largely manual, and there is no strategy, budget, or talent dedicated to AI. Leadership views AI as irrelevant or a distant-future concern.

Level 2 — AI Curious

Score Range: 1.6 – 2.5

Leadership has begun exploring AI concepts. The organization may be piloting basic analytics or business intelligence dashboards. Data is partially centralized but quality remains inconsistent. There is growing interest but no formal strategy, dedicated team, or governance framework.

Level 3 — AI Experimenting

Score Range: 2.6 – 3.5

The organization is actively experimenting with AI in one or more pilot projects. A small data science capability exists (internal or outsourced). Key data is centralized and basic governance is in place. At least one AI use case has been identified with estimated ROI. Core processes are digitized.

Level 4 — AI Operational

Score Range: 3.6 – 4.5

AI models are deployed in production and delivering measurable business value. A dedicated AI team operates within a formal strategy. Data infrastructure is mature, governance policies are enforced, and model monitoring is automated. Multiple use cases are in production with tracked ROI.

Level 5 — AI Transformational

Score Range: 4.6 – 5.0

AI is a core driver of the organization’s competitive advantage. Every major business function is enhanced by AI. The organization operates a full MLOps pipeline, maintains an AI Center of Excellence, and continuously innovates. AI governance is enterprise-grade with ethics oversight.

3. Assessment Questionnaire

The assessment consists of 18 questions: 16 scored questions across the seven maturity dimensions plus 2 contextual questions (organization size and industry) that do not affect the maturity score but are used to tailor roadmap recommendations.

Each scored question presents five answer choices mapped to maturity levels 1 through 5. The respondent selects the single option that best describes their organization's current state.

3.1 Business Strategy

BS1. How well does your senior leadership understand the potential of AI for your business?

	Answer Option	Score
A	Leadership has no awareness of AI or its relevance	1
B	Leadership has heard about AI but sees it as hype	2
C	Leadership is interested and exploring AI possibilities	3
D	Leadership actively sponsors AI initiatives with dedicated budget	4
E	AI is embedded in the company's core strategy and led from the top	5

BS2. Does your organization have a formal AI or digital transformation strategy?

	Answer Option	Score
A	No strategy exists	1
B	Informal discussions are happening but nothing documented	2
C	A strategy is being developed or is in early draft form	3
D	A formal strategy exists and is being executed	4
E	The AI strategy is integrated into the overall business strategy and regularly reviewed	5

BS3. How is AI investment prioritized in your organization?

	Answer Option	Score
A	There is no budget allocated for AI	1
B	AI funding is ad-hoc and project-based	2
C	A dedicated budget exists for AI experimentation	3
D	AI investment is part of the annual technology budget with clear KPIs	4
E	AI investment is treated as a strategic priority with board-level oversight	5

3.2 Data Readiness

DR1. How would you describe the state of your organization's data?

	Answer Option	Score
A	Data is scattered across spreadsheets and individual systems with no central access	1
B	Some data is centralized but most still lives in silos	2
C	Key business data is centralized in databases or a data warehouse	3
D	Data is well-organized, governed, and accessible across departments	4
E	A comprehensive data platform exists with real-time pipelines and strong governance	5

DR2. How confident are you in the accuracy and completeness of your data?

	Answer Option	Score
A	We frequently encounter errors, duplicates, and missing data	1
B	Data quality is inconsistent; some areas are good while others are poor	2
C	We have basic data quality checks in place	3
D	Formal data quality processes and ownership exist across the organization	4
E	Automated data quality monitoring is in place with clear accountability	5

DR3. Does your organization have formal rules about who can access, change, and use data (data governance)?

	Answer Option	Score
A	No formal data governance exists	1
B	Informal rules exist but are not consistently followed	2
C	Basic governance policies are documented and partially enforced	3
D	Data governance is well-established with defined roles and regular audits	4
E	Advanced governance framework with automated policy enforcement and compliance tracking	5

3.3 Technology Infrastructure

TI1. What best describes your organization's use of cloud computing?

	Answer Option	Score
A	We run everything on physical servers on our premises	1
B	We use some cloud services (e.g., email, file storage) but core systems are on-premises	2

C	We are actively migrating key systems to the cloud	3
D	Most of our systems and data are cloud-based	4
E	We operate a fully cloud-native environment with scalable AI/ML infrastructure	5

TI2. How well do your different software systems and tools share data with each other?

	Answer Option	Score
A	Our systems do not communicate; data is manually transferred	1
B	A few systems are connected but most operate independently	2
C	We have some integrations (APIs or middleware) between key systems	3
D	Most systems are integrated with established data flows	4
E	Fully integrated ecosystem with an API-first architecture and real-time data exchange	5

3.4 Talent & Skills

TS1. Does your organization have people with AI, machine learning, or data science skills?

	Answer Option	Score
A	No one in the organization has AI or data science skills	1
B	A few individuals have basic data analysis skills but no AI expertise	2
C	We have hired or are hiring data analysts and/or data scientists	3
D	We have a dedicated data science or AI team working on projects	4
E	We have a mature AI Center of Excellence with specialists across the organization	5

TS2. How comfortable are your non-technical teams with using data to make decisions?

	Answer Option	Score
A	Decisions are largely based on intuition or experience, not data	1
B	Some teams use basic reports or dashboards but most do not	2
C	Most teams have access to dashboards and use data for routine decisions	3
D	Data-driven decision making is standard across departments	4
E	All teams use advanced analytics and AI-powered insights in daily work	5

3.5 Use Case Readiness

UC1. Has your organization identified specific business problems that AI could help solve?

	Answer Option	Score
A	We have not thought about where AI could be applied	1
B	We have general ideas but nothing specific or documented	2
C	We have identified 2–3 specific use cases with clear business problems	3
D	Multiple use cases are documented with expected business value and prioritized	4
E	A managed portfolio of AI use cases exists, with active projects delivering measurable ROI	5

UC2. Have you estimated the expected return on investment (ROI) for any AI initiatives?

	Answer Option	Score
A	We have not estimated ROI for any AI project	1
B	We have rough estimates but they are not based on data	2
C	We have estimated ROI for at least one use case with supporting data	3
D	ROI models exist for multiple use cases and are reviewed regularly	4
E	AI ROI is tracked in real time and feeds into investment decisions	5

3.6 Operational Readiness

OR1. How digitized are your core business processes?

	Answer Option	Score
A	Most processes are manual and paper-based	1
B	Some processes are digitized but many still rely on manual work	2
C	Core processes are digitized with software tools managing key workflows	3
D	Most processes are digitized and some are automated	4
E	End-to-end process automation with intelligent workflows powered by AI	5

OR2. How would you rate your organization's ability to manage change (e.g., adopting new tools or processes)?

	Answer Option	Score
A	Change is resisted; there is no formal change management process	1
B	Change happens slowly; people are hesitant to adopt new tools	2
C	We have some change management practices and training programs	3

D	Change management is well-structured with communication plans and stakeholder engagement	4
E	The organization embraces continuous change with agile practices and a culture of experimentation	5

3.7 AI Governance

AG1. Does your organization have policies around responsible and ethical use of AI?

	Answer Option	Score
A	We have no policies related to AI ethics or governance	1
B	We are aware of the need but have not created any policies	2
C	Basic guidelines exist (e.g., data privacy compliance)	3
D	Formal AI governance policies are in place covering ethics, bias, and transparency	4
E	A comprehensive AI governance framework is actively enforced with regular audits and a dedicated ethics board	5

AG2. If you are already using AI or machine learning models, how do you monitor their performance?

	Answer Option	Score
A	We are not using any AI models	1
B	We have deployed models but do not actively monitor them	2
C	We check model performance periodically on a manual basis	3
D	Automated monitoring dashboards track model accuracy and drift	4
E	Full MLOps pipeline with automated retraining, version control, and continuous monitoring	5

3.8 Context

CTX1. What is the approximate size of your organization?

	Answer Option	Score
A	Fewer than 50 employees	—
B	50–250 employees	—
C	251–1,000 employees	—
D	1,001–10,000 employees	—
E	More than 10,000 employees	—

CTX2. Which industry does your organization primarily operate in?

(If none of the above apply, please specify in the optional text field.)

	Answer Option	Score
A	Retail / E-Commerce	—
B	Healthcare / Life Sciences	—
C	Financial Services / Banking / Insurance	—
D	Manufacturing / Supply Chain / Logistics	—
E	Technology / Media / Telecommunications	—

Optional Long-Text Prompt (shown after all scored questions):

"Please describe in a few sentences any AI or automation initiatives your organization has already attempted, and the outcomes of those efforts."

This open-ended response provides qualitative context for more tailored roadmap recommendations. It is not scored.

4. Scoring Methodology

4.1 Dimension Scoring

Each scored dimension contains 2–3 questions. The dimension score is the arithmetic mean (average) of the individual question scores within that dimension, yielding a value between 1.0 and 5.0.

Formula: Dimension Score = Sum of question scores in dimension ÷ Number of questions in dimension

4.2 Dimension Weights

Some dimensions have a greater practical impact on AI readiness than others. The following weights are applied when computing the overall maturity score:

Dimension	Questions	Weight
Business Strategy	3 questions	20%
Data Readiness	3 questions	20%
Technology Infrastructure	2 questions	15%
Talent & Skills	2 questions	15%
Use Case Readiness	2 questions	10%
Operational Readiness	2 questions	10%
AI Governance	2 questions	10%

4.3 Overall Maturity Score

The Overall Maturity Score is the weighted average of all dimension scores:

Overall Score = (BS × 0.20) + (DR × 0.20) + (TI × 0.15) + (TS × 0.15) + (UC × 0.10) + (OR × 0.10) + (AG × 0.10)

This produces a single number between 1.0 and 5.0 that maps directly to the maturity levels defined in Section 2.

5. Maturity Classification Logic

The overall maturity score is classified using the following deterministic thresholds:

Overall Score Range	Maturity Level	Label
1.00 – 1.50	Level 1	AI Unaware
1.51 – 2.50	Level 2	AI Curious
2.51 – 3.50	Level 3	AI Experimenting
3.51 – 4.50	Level 4	AI Operational
4.51 – 5.00	Level 5	AI Transformational

5.1 Blocker Rule

In addition to the overall score, the system applies a blocker rule: if any single dimension scores below 2.0, the overall maturity level is capped at Level 2 regardless of the weighted average. This prevents an organization with a critical gap from being classified as more advanced than it practically is.

5.2 Consistency Check

If the gap between the highest and lowest dimension scores exceeds 2.0 points, the report flags an “uneven maturity” warning and recommends addressing the weakest dimension before pursuing advanced AI initiatives.

6. AI Assessment Report Structure

After the assessment is completed, the system generates a report with the following sections.

6.1 Executive Summary

A one-paragraph overview stating the organization's maturity level, overall score, and the two most critical findings (strongest dimension and weakest dimension).

6.2 Overall Maturity Level

The maturity level and score displayed prominently, with a brief description of what this level means in practical terms.

6.3 Score Breakdown by Dimension

A table or chart showing the score for each of the seven dimensions, enabling the organization to see where it is strong and where it lags.

6.4 Key Strengths

The top 2–3 dimensions where the organization scores highest. Each strength is accompanied by one sentence explaining how it can be leveraged to accelerate AI adoption.

6.5 Key Gaps

The bottom 2–3 dimensions where the organization scores lowest. Each gap includes a concrete explanation of the risk it poses and why it must be addressed.

6.6 Immediate Opportunities

Two to three quick-win AI use cases that match the organization's current capabilities. These should be achievable within 3–6 months, require minimal new infrastructure, and deliver visible business value.

6.7 Risks & Blockers

Any critical barriers that could prevent successful AI adoption, such as a dimension scoring below 2.0, regulatory constraints, or severe talent shortages. Each risk includes a recommended mitigation action.

7. AI Implementation Roadmap Template

The roadmap is generated dynamically based on the organization's maturity level. Organizations at Level 1 or 2 start at Phase 1. Organizations at Level 3 begin at Phase 2. Organizations at Level 4 start at Phase 3. Level 5 organizations receive an optimization plan.

Phase 1 — Foundation (Months 1–6)

Build the basic prerequisites for AI adoption.

Key Objectives:

- Establish an AI strategy document aligned with business goals.
- Centralize and clean core business data into a single repository.
- Conduct an enterprise-wide data audit to catalog available data assets.
- Secure executive sponsorship with a named AI champion at the leadership level.

Recommended Initiatives:

- Deploy a cloud-based data warehouse (e.g., Snowflake, BigQuery, or Azure Synapse) and migrate data from spreadsheets and legacy databases.
- Implement basic data governance: define data owners, access policies, and quality standards.
- Provide data literacy training for managers and key business users.
- Run a discovery workshop to identify and prioritize 3–5 potential AI use cases by business impact and feasibility.

Example Use Cases:

- Automated report generation: Replace manual weekly reports with automated dashboards pulling from the new data warehouse.
- Customer segmentation: Use historical purchase data to segment customers into value tiers for targeted marketing.
- Inventory visibility: Build a unified inventory view across locations to reduce stockouts.

Technology Requirements: Cloud storage account, data warehouse platform, business intelligence tool (e.g., Power BI, Tableau, Looker).

Team Requirements: 1 data engineer (or outsourced), 1 project lead, executive sponsor.

Estimated Timeline: 3–6 months.

Phase 2 — Pilot Projects (Months 4–12)

Launch initial AI projects that deliver measurable business value and build organizational confidence.

Key Objectives:

- Deliver at least one AI proof-of-concept with quantified business impact.
- Build or acquire initial data science and ML engineering capability.
- Establish a repeatable process for evaluating, building, and deploying models.

Recommended Initiatives:

- Select the highest-impact, lowest-complexity use case from Phase 1 discovery and build an end-to-end proof of concept.
- Hire or contract a data scientist and a data/ML engineer.
- Set up a development environment with version-controlled notebooks and experiment tracking (e.g., MLflow).
- Implement model evaluation standards: define accuracy, fairness, and business-value metrics before deployment.
- Create a feedback loop with business stakeholders to validate model outputs against real-world outcomes.

Example Use Cases:

- Demand forecasting: Build a time-series forecasting model using 24 months of historical sales data to predict weekly demand by product category.
- Customer churn prediction: Train a classification model to identify at-risk customers using transaction frequency, support-ticket volume, and engagement metrics.
- Document classification: Deploy a natural language processing model to automatically categorize incoming support tickets or invoices.

Technology Requirements: ML experimentation platform, feature store or feature engineering pipeline, cloud compute for model training (e.g., AWS SageMaker, Google Vertex AI, Azure ML).

Team Requirements: 1–2 data scientists, 1 ML engineer, product owner from the business.

Estimated Timeline: 6–12 months (overlaps with late Phase 1).

Phase 3 — Scaling AI (Months 10–24)

Move from individual pilots to production-grade AI systems operating across multiple business functions.

Key Objectives:

- Deploy multiple AI models in production with automated monitoring.
- Establish an MLOps pipeline for continuous integration and delivery of models.
- Implement enterprise AI governance covering ethics, bias testing, and compliance.

Recommended Initiatives:

- Build a centralized ML platform with model registry, automated training pipelines, and deployment infrastructure.
- Implement model monitoring dashboards that track accuracy drift, data drift, and prediction volume in real time.
- Create a formal AI governance committee with defined policies on data privacy, algorithmic fairness, and explainability.
- Establish a reusable feature store so data features can be shared across projects, reducing duplication.
- Expand data engineering capacity to support increasing data volumes and real-time data pipelines.

Example Use Cases:

- Dynamic pricing: Deploy a real-time pricing optimization engine that adjusts prices based on demand signals, competitor data, and inventory levels.

- Predictive maintenance: Use sensor data from equipment to predict failures 7–14 days in advance, reducing unplanned downtime by 30% or more.
- Intelligent process automation: Combine robotic process automation (RPA) with NLP models to automate end-to-end invoice processing including extraction, validation, and exception handling.

Technology Requirements: MLOps platform, container orchestration (e.g., Kubernetes), CI/CD for models, real-time data streaming (e.g., Kafka), model monitoring tools (e.g., Evidently, Fiddler).

Team Requirements: AI/ML team of 5–10+, data engineering team, AI product managers, governance lead.

Estimated Timeline: 12–24 months.

Phase 4 — AI-Driven Organization (Month 18+)

Transform the organization so that AI is a core capability embedded in every major function and decision.

Key Objectives:

- Embed AI-powered decision-making into all major business processes.
- Operate a self-service AI platform that enables business teams to build and deploy their own models.
- Achieve continuous improvement through automated model retraining, A/B testing, and feedback loops.

Recommended Initiatives:

- Launch an internal AI Center of Excellence to develop best practices, provide training, and coordinate AI initiatives across the organization.
- Deploy a self-service analytics and ML platform that allows non-technical users to build predictive models with guided workflows.
- Implement AI-driven strategic planning: use scenario-modeling tools to simulate the business impact of strategic decisions before committing resources.
- Invest in frontier capabilities such as generative AI for content creation, knowledge management, and agent-based workflows.
- Establish external partnerships with AI research institutions or vendors to stay at the leading edge.

Example Use Cases:

- AI-powered product development: Use generative design tools and customer-feedback analysis to accelerate new-product development cycles by 40%.
- Autonomous supply chain optimization: Deploy reinforcement-learning models that autonomously balance inventory levels, logistics routes, and supplier relationships.
- Enterprise knowledge assistant: Build a retrieval-augmented generation (RAG) system that enables employees to query internal documents, policies, and data using natural language.

Technology Requirements: Enterprise AI platform, self-service ML tools, advanced MLOps with automated retraining, real-time data mesh or lakehouse architecture, vector databases for RAG systems.

Team Requirements: AI Center of Excellence (10–20+), embedded AI practitioners in each business unit, Chief AI Officer or equivalent.

Estimated Timeline: Ongoing, with initial capability in 18–30 months.

8. Example Output for a Sample Organization

The following illustrates a complete assessment output for a fictional mid-sized retail company.

8.1 Organization Profile

Company: RetailCo (fictional)

Industry: Retail / E-Commerce

Size: 500 employees

8.2 Dimension Scores

Dimension	Score	Weight
Business Strategy	3.0	20%
Data Readiness	2.3	20%
Technology Infrastructure	3.0	15%
Talent & Skills	2.0	15%
Use Case Readiness	2.5	10%
Operational Readiness	3.0	10%
AI Governance	1.5	10%

Weighted Overall Score: (3.0×0.20) + (2.3×0.20) + (3.0×0.15) + (2.0×0.15) + (2.5×0.10) + (3.0×0.10) + (1.5×0.10) = 2.51

8.3 Classification

Overall Score: 2.51

Maturity Level: Level 3 — AI Experimenting

Blocker Rule: AI Governance scores 1.5 (below 2.0). Overall level is capped at Level 2 — AI Curious until this gap is resolved.

Adjusted Maturity Level: Level 2 — AI Curious

8.4 Key Strengths

- Business Strategy (3.0): Leadership is engaged and exploring AI actively. This executive interest can be leveraged to secure budget and sponsorship for initial projects.
- Operational Readiness (3.0): Core processes are already digitized, providing a solid foundation for layering AI-driven automation.

8.5 Key Gaps

- AI Governance (1.5): The absence of any AI governance policies is a critical blocker. Without governance, any deployed model carries legal and reputational risk.
- Talent & Skills (2.0): The organization lacks dedicated data science capability and general data literacy is low, making it difficult to execute even basic AI pilots.
- Data Readiness (2.3): Data quality is inconsistent and governance is informal. Models trained on poor data will produce unreliable results.

8.6 Immediate Opportunities

- Implement demand forecasting using 2 years of historical point-of-sale data and a basic time-series model to improve inventory planning accuracy by 15–25%.
- Deploy automated product-recommendation emails using customer purchase history and a collaborative filtering approach.
- Build a real-time sales dashboard replacing manual weekly reports, freeing 5–10 hours of analyst time per week.

8.7 Risks & Blockers

- Critical: AI Governance score of 1.5 triggers the blocker rule. Recommended action: draft and ratify an AI acceptable-use policy, appoint a data privacy officer, and complete a basic compliance review within 90 days.
- High: Talent gap prevents execution. Recommended action: hire or contract one senior data scientist and enroll 10 business managers in a data literacy program.
- Medium: Data quality issues may undermine pilot accuracy. Recommended action: run a data quality audit on the top 3 data sources and remediate critical issues before starting any modeling work.

8.8 Recommended Roadmap Starting Point

Because RetailCo’s adjusted maturity is Level 2, the recommended roadmap begins at Phase 1 (Foundation), with immediate priority given to resolving the AI Governance blocker. Once governance and data readiness gaps are addressed (estimated 3–4 months), the organization should advance directly to Phase 2 (Pilot Projects) to capitalize on its existing leadership engagement and operational readiness.

Appendix: Developer Implementation Notes

A.1 Data Model

Each question should be stored as an object with the following fields: id (string), dimension (string), question_text (string), options (array of objects with text and score), and is_scored (boolean). Context questions (CTX1, CTX2) have is_scored set to false.

A.2 Score Computation

For each dimension, compute the mean of the question scores in that dimension. Multiply each dimension mean by its weight (see Section 4.2). Sum the weighted values to get the overall score. Apply the blocker rule (Section 5.1) and consistency check (Section 5.2) after computing the overall score.

A.3 Roadmap Generation Logic

The roadmap starting phase is determined by the adjusted maturity level: Level 1–2 starts at Phase 1; Level 3 starts at Phase 2; Level 4 starts at Phase 3; Level 5 receives an optimization plan. Within each phase, surface the recommended initiatives from the template in Section 7 and additionally append any dimension-specific remediation actions triggered by gaps identified in the report.

A.4 Extensibility

The questionnaire is modular by design. To add new questions, append them to the appropriate dimension with a unique ID, provide five answer options mapped to scores 1–5, and update the dimension question count and weight table. The scoring and classification logic will automatically incorporate new questions without modification.

A.5 Industry and Size Adaptations

Use the CTX1 (size) and CTX2 (industry) answers to tailor the example use cases and technology recommendations in the roadmap. For small organizations (under 250 employees), emphasize low-cost cloud tools and outsourced talent. For large enterprises, emphasize platform-building and Center of Excellence structures. For healthcare organizations, emphasize compliance and HIPAA considerations. For financial services, emphasize regulatory risk and fraud detection use cases. The core maturity levels and scoring remain consistent regardless of size or industry.
